

ABSTRACT

5 METHOD AND SYSTEM FOR SELECTION OF MODE OF
OPERATION OF A SERVICE IN LIGHT OF USE OF ANOTHER
SERVICE IN AN ADSL SYSTEM

Methods and systems for use in connection with an

10 asymmetrical digital subscriber line (ADSL) system being available
to provide voice service and data service to the customer's premises.
One service of the voice service or the data service is in use at the
customer's premises, and the exemplary methods and systems detect a
request for provision of the other service. In response to the

15 detection, impact information may be provided on performance of the
one service in light of concurrent use of the other service. A list of
modes of operation of the other service is provided. The subscriber
may consider the impact information and the list of modes and
respond with a selected mode of operation of the other service. The

20 selected mode is detected and the other service is operated pursuant to
the selected mode to the customer's premises.
